$h = 0 + 14t + 5(2t) = 14t + 10t$. Which tells us the slope of the function at any time t .

We used these Derivative Rules: The slope of a constant value (like 3) is 0; The slope of a line like $2x$ is 2, so $14t$ has a slope of 14; A square function like t^2 has a slope of $2t$, so $5t^2$ has a slope of $5(2t)$

But the derivative of x^4 would have been $4x^3$ and there is no x^4 in our first term.

Therefore, this x^4 must cancel out to have the correct derivative. It seems that $(\frac{1}{4})x^4$ must be differentiated so as to attain x^3 .

Similarly, the expression $4x$ would be attained if we differentiate $(\frac{4}{2})x^2$.
